

Technology Stack

Project: PocketSmart AI – Your Smart Budget & Recommendation Assistant

1. Technology Stack Overview

Layer	Technology	Purpose
Programming Language	Python	Application and backend development.
Backend Framework	FastAPI	Provides API routes and backend application logic.
AI Layer	Gemini AI	Generates budget-based recommendations from user requirements
Frontend	HTML, CSS, JavaScript	Provides the user interface and planner forms.
Templating	Jinja2	Supports server-side HTML templates.
Authentication	User Login / Authentication	Controls access to application features.
Deployment	Render	Hosts the deployed application.

2. AI and Recommendation Flow

User requirements are collected through the frontend and sent to the FastAPI backend. The backend sends the relevant planning information to Gemini AI, which generates the recommendation. The result is then returned to the application and displayed to the user.

3. Application Modules

- User Registration and Login
- Home Planner
- Party Planner
- Jewelry Planner
- Gemini AI Recommendation Engine
- Recommendation History
- Recommendation Details

4. Deployment

The completed application is deployed using Render and is accessible through the project's live demo URL.
