

Code-Layout, Readability and Reusability

Project: PocketSmart AI – Your Smart Budget & Recommendation Assistant

Code Layout

- The project separates frontend, backend, planner workflows, recommendation handling, and supporting project files.
- FastAPI routes are organized around the main Home, Party, and Jewelry planner functions.

Readability

- Clear route names such as /generate-home, /generate-party, and /generate-jewelry make the API purpose understandable.
- Planner inputs and recommendation outputs are presented through structured pages.

Reusability

- Common authentication, session, history, and recommendation-detail functionality can be reused across planners.
- The three planner workflows follow a similar input → AI generation → recommendation display pattern.

Quality Practices

- Use meaningful names, consistent formatting, modular functions, and comments where needed.
- Keep configuration and reusable logic separate from page-specific code.
