

Brainstorming & Idea Prioritization

Project: PocketSmart AI – Your Smart Budget & Recommendation Assistant

1. Brainstorming

The initial idea was to develop an AI-powered assistant that can help users make planning and purchasing decisions based on a fixed budget. The brainstorming focused on common situations where users need recommendations while controlling their spending.

Idea	Description
Home Planner	Generate budget-based suggestions for home requirements such as rooms and quantities.
Party Planner	Generate recommendations based on budget, guest count, event type and venue.
Jewelry Planner	Generate jewelry suggestions based on budget, occasion and preferred style, with options.
Budget Recommendation Assistant	Provide AI-generated recommendations according to user requirements and budget.

2. Idea Prioritization

The ideas were organized around the main requirement: providing useful recommendations while considering the user's budget. The project was planned as a single application containing three related planning modules.

Priority	Selected Module	Reason
1	Home Planner	Supports budget-based home planning requirements.
2	Party Planner	Supports budget allocation for party-related requirements.
3	Jewelry Planner	Supports budget-based jewelry selection for different occasions.

3. Proposed Solution

PocketSmart AI was selected as the project concept. It uses a GenAI-based recommendation approach to generate suggestions from user inputs such as budget and planning requirements. The application includes Home, Party and Jewelry planners, along with recommendation history and recommendation details.

4. Expected Outcome

The expected outcome is an easy-to-use application that helps users generate budget-conscious recommendations for different planning needs through an AI-powered interface.
